

MA 280-Assignment #2: VECTORS AND THE GEOMETRY OF SPACE- Part II

Example 1

We can use the dot product command to write an equation of the plane through the point $(2, 4, -1)$ with normal vector $n = \langle 2, 3, 4 \rangle$:

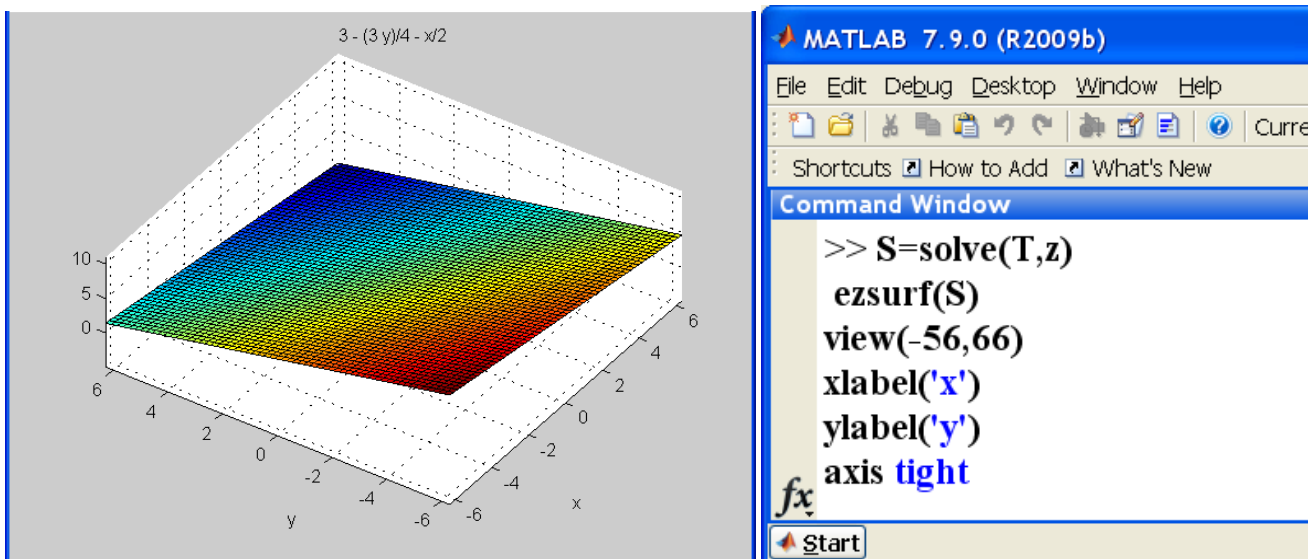

```
MATLAB 7.9.0 (R2009b)
File Edit Debug Desktop Window Help
Current Folder: F:\MATLAB_Documents\MA280_projects\Vector_Functions
Shortcuts How to Add What's New
Command Window
>> syms x y z
r=[x,y,z];
r0=[2,4,-1];
n=[2,3,4];
T=dot(n,r-r0)

T =

2*x + 3*y + 4*z - 12
```

Thus the equation of the desired plane is $T = 0$ or $2x + 3y + 4z - 12 = 0$.

If you wish to visualize the plane, then solve for z in terms of x and y then use the MATLAB command `ezsurf` to plot the plane $z = f(x, y)$:

Note that MATLAB allows you to rotate the figure and select a suitable view. The above figure was captured with the `view(-56, 66)`.

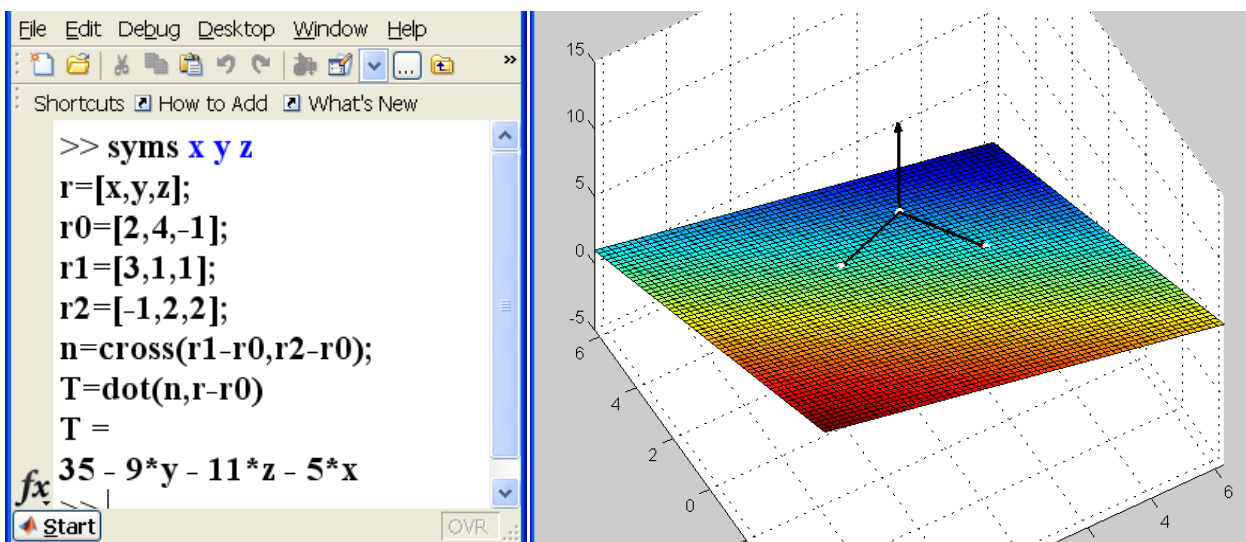

Remark : while it is possible to draw the plane $2x + 3y + 4z - 12 = 0$ together with the normal vector $n = \langle 2, 3, 4 \rangle$ at the point $(2, 4, -1)$, we prefer to postpone the details until later on in the tutorial.

Example 2

Find an equation of the plane through the points $(2, 4, -1)$, $(3, 1, 1)$, and $(-1, 2, 2)$.

Let $r_0 = (2, 4, -1)$, $r_1 = (3, 1, 1)$, and $r_2 = (-1, 2, 2)$. We use the cross product to calculate a normal vector to the plane $\vec{n} = \overrightarrow{r_1 r_0} \times \overrightarrow{r_2 r_0}$.

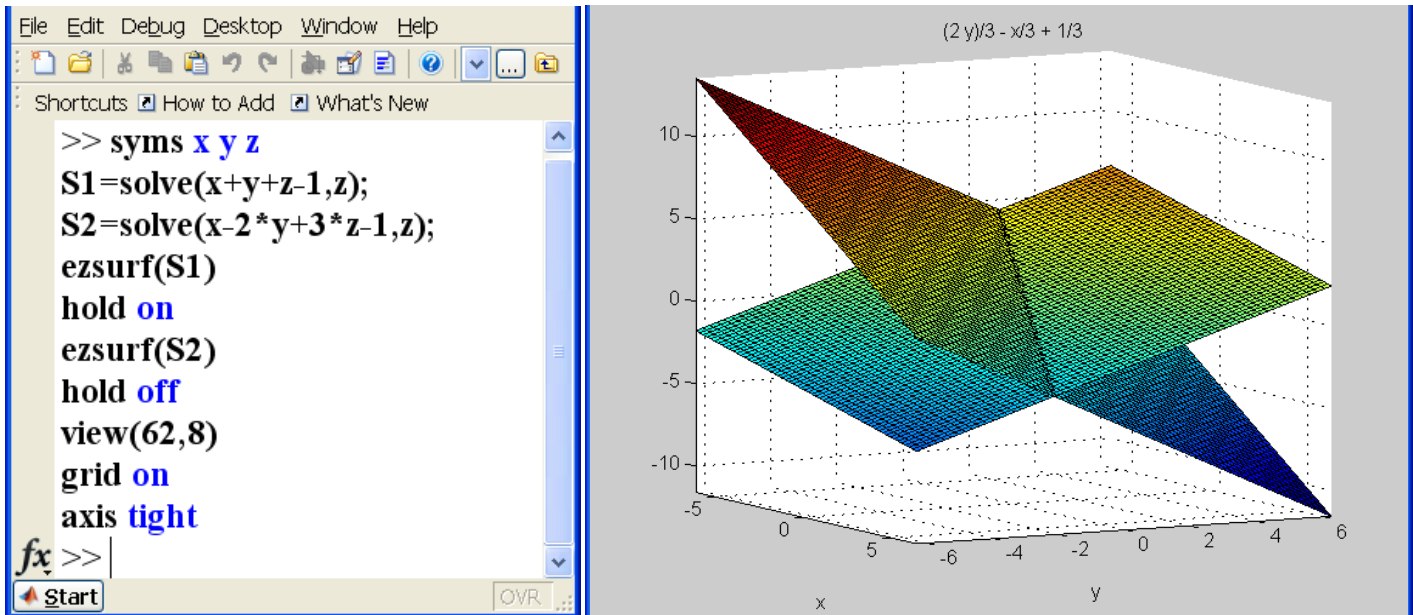

Therefore the equation of the plane is $-5x - 9y - 11z + 35 = 0$.

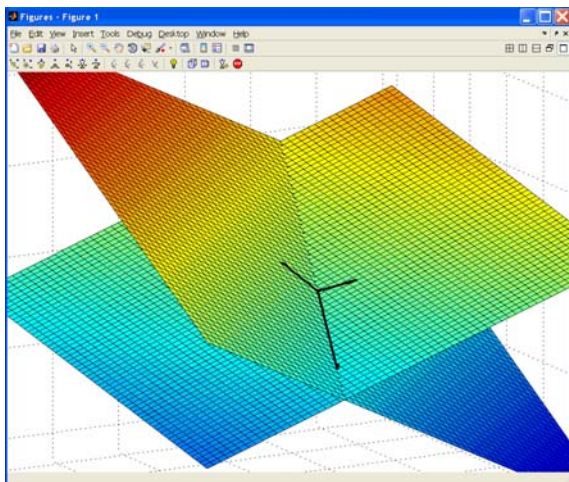

Example 3

Consider the planes $x + y + z = 1$ and $x - 2y + 3z = 1$. Clearly the two planes are not parallel hence they intersect in a line L .

We can solve the above equations for z and use the command `ezsurf` to plot the two planes.

Let $n_1 = \langle 1, 1, 1 \rangle$ and $n_2 = \langle 1, -2, 3 \rangle$ be the normal vectors to the two planes. One way to determine the line of intersection L is to observe that the cross product $n_1 \times n_2$ is parallel to L . We can verify this fact by drawing n_1 , n_2 , and $n_1 \times n_2$ at the point $(1, 0, 0)$.

Alternatively, we find two points on L then use them to write an equation of the line of intersection.

Any point in the intersection of the two planes must satisfy the system: $\begin{cases} x + y + z = 1 \\ x - 2y + 3z = 1 \end{cases}$ which, as expected, has an infinite number of solutions. Therefore for each pre-assigned value of z we obtain a point in the line L .

We rewrite the system in the following form: $\begin{cases} x + y + z = 1 \\ x - 2y + 3z = 1 \\ z = z \end{cases}$.

Put $A = \begin{bmatrix} 1 & 1 & 1 \\ 1 & -2 & 3 \\ 0 & 0 & 1 \end{bmatrix}$ and $b = \begin{bmatrix} 1 \\ 1 \\ z \end{bmatrix}$. We can use MATLAB to solve the system:

```
File Edit Debug Desktop Window Help
Shortcuts How to Add What's New
>> syms z real
A=[1 1 1;1 -2,3;0 0 1];
b=[1 1 z]';
S=(A\b)'
S =
[ 1 - (5*z)/3, (2*z)/3, z]
fx >> |
Start OVR
```

Note that the solution S is given in terms of z ; that is for each choice of z we obtain a point in the line of intersection L .

If we let $z = 0$, we obtain a point $P_0 = (1,0,0)$:

```
File Edit Debug Desktop Window Help
Shortcuts How to Add What's New
>> P0=subs(S,0)
P0 =
1 0 0
fx >> |
Start OVR
```

and if we let $z = 1$, we obtain a point $P_1 = (-\frac{2}{3}, \frac{2}{3}, 1)$:

```
File Edit Debug Desktop Window Help
Shortcuts How to Add What's New
>> P1=subs(S,1)
P1 =
-0.6667 0.6667 1.0000
fx >> |
Start OVR
```

or

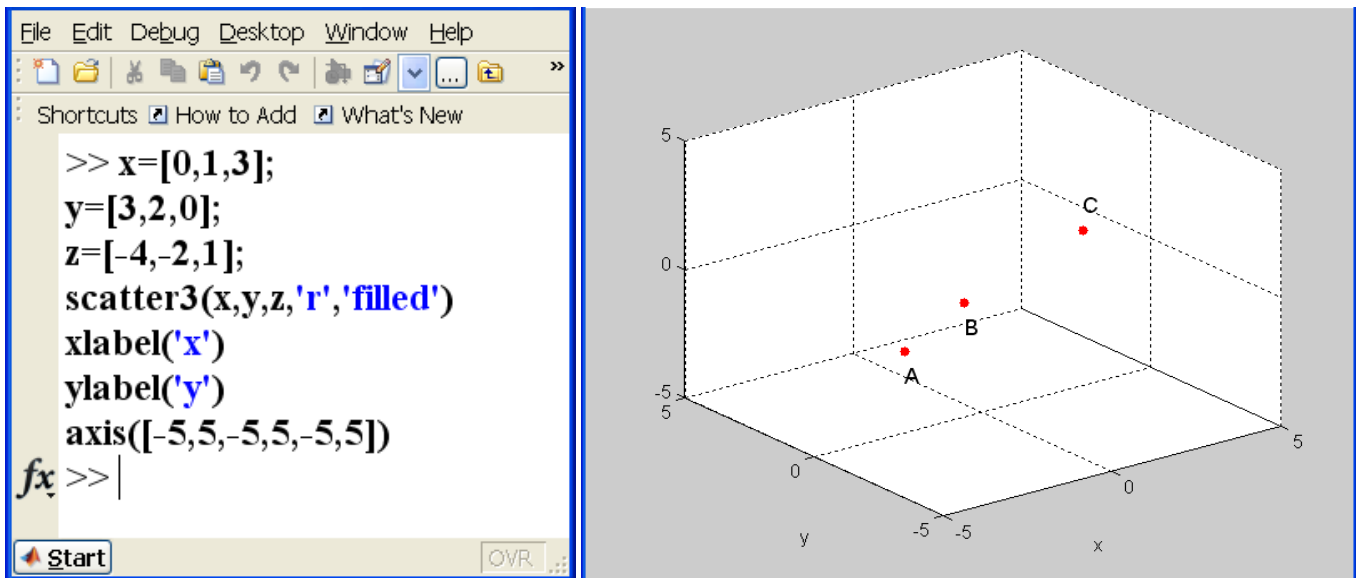

```
File Edit Debug Desktop Window Help
Shortcuts How to Add What's New
>> P1=sym(subs(S,1))
P1 =
[-2/3, 2/3, 1]
fx >> |
Start OVR
```

Having two points, we can easily write the equation of the line of intersection L . We leave the details as an exercise.

Example 4

Occasionally we are able to determine from a graph whether two or more points lie on the same line.

Consider the points $A(0,3,-4)$, $B(1,2,-2)$, and $C(3,0,1)$. We can use the MATLAB command `scatter` to plot the points and determine whether they lie on the same line or not.

Exercise MA 280-2 (Solution at the end of document)

Use MATLAB to

- Plot the planes $x + y - z = 2$ and $2x - y + 3z = 1$ on the same figure
- Find two points on the line of intersection of the planes in part(a)
- Plot the point $(-1, 2, 1)$ together with the two points obtained in part (b). Are they on the same line?
- Find two vectors in the plane that passes through the point $(-1, 2, 1)$ and contains the line of intersection of the planes $x + y - z = 2$ and $2x - y + 3z = 1$.
- Find an equation of the plane that passes through the point $(-1, 2, 1)$ and contains the line of intersection of the planes $x + y - z = 2$ and $2x - y + 3z = 1$.
